1 Locally convex spaces

If V is a vector space and $\{p_\alpha : \alpha \in A\}$ is a separating family of seminorms on V , then there is a unique topology with which V is a locally convex space and such that the collection of finite intersections of sets of the form

$$\{v \in V : p_\alpha(v) < \epsilon\}, \quad \alpha \in A, \quad \epsilon > 0$$

is a local base at 0.¹ We call this the **topology induced by the family of seminorms**. If $\{p_n : n \geq 0\}$ is a separating family of seminorms, then

$$d(v, w) = \sum_{n=0}^{\infty} 2^{-n} \frac{p_n(v - w)}{1 + p_n(v - w)}, \quad v, w \in V,$$

is a metric on V that induces the same topology as the family of seminorms. If d is a complete metric, then V is called a **Fréchet space**.

2 Schwartz functions

For $\phi \in C^\infty(\mathbb{R}, \mathbb{C})$ and $n \geq 0$, let

$$p_n(\phi) = \sup_{0 \leq k \leq n} \sup_{u \in \mathbb{R}} (1 + u^2)^{n/2} |\phi^{(k)}(u)|.$$

We define \mathcal{S} to be the set of those $\phi \in C^\infty(\mathbb{R}, \mathbb{C})$ such that $p_n(\phi) < \infty$ for all $n \geq 0$. \mathcal{S} is a complex vector space and each p_n is a norm, and because each p_n is a norm, a fortiori $\{p_n : n \geq 0\}$ is a separating family of seminorms. With the topology induced by this family of seminorms, \mathcal{S} is a Fréchet space.² As well, $D : \mathcal{S} \rightarrow \mathcal{S}$ defined by

$$(D\phi)(x) = \phi'(x), \quad x \in \mathbb{R}$$

and $M : \mathcal{S} \rightarrow \mathcal{S}$ defined by

$$(M\phi)(x) = x\phi(x), \quad x \in \mathbb{R}$$

are continuous linear maps.

¹<http://individual.utoronto.ca/jordanbell/notes/holomorphic.pdf>, Theorem 1 and Theorem 4.

²Walter Rudin, *Functional Analysis*, second ed., p. 184, Theorem 7.4.

3 Hermite functions

Let λ be Lebesgue measure on \mathbb{R} and let

$$(f, g)_{L^2} = \int_{\mathbb{R}} f \bar{g} d\lambda.$$

With this inner product, $L^2(\lambda)$ is a separable Hilbert space. We write

$$\|f\|_{L^2}^2 = (f, f)_{L^2} = \int_{\mathbb{R}} |f|^2 d\lambda.$$

For $n \geq 0$, define $H_n : \mathbb{R} \rightarrow \mathbb{R}$ by

$$H_n(x) = (-1)^n e^{x^2} D^n e^{-x^2},$$

which is a polynomial of degree n . H_n are called **Hermite polynomials**. It can be shown that

$$\exp(2zx - z^2) = \sum_{n=0}^{\infty} \frac{1}{n!} H_n(x) z^n, \quad z \in \mathbb{C}. \quad (1)$$

For $m, n \geq 0$,

$$\int_{\mathbb{R}} H_m(x) H_n(x) e^{-x^2} d\lambda(x) = 2^n n! \sqrt{\pi} \delta_{m,n}.$$

For $n \geq 0$, define $h_n : \mathbb{R} \rightarrow \mathbb{R}$ by

$$h_n(x) = (2^n n! \sqrt{\pi})^{-1/2} e^{-x^2/2} H_n(x) = (-1)^n (2^n n! \sqrt{\pi})^{-1/2} e^{x^2/2} D^n e^{-x^2}.$$

h_n are called **Hermite functions**. Then for $m, n \geq 0$,

$$(h_m, h_n)_{L^2} = \int_{\mathbb{R}} h_m(x) h_n(x) d\lambda(x) = \delta_{m,n}.$$

One proves that $\{h_n : n \geq 0\}$ is an orthonormal basis for $(L^2(\lambda), (\cdot, \cdot)_{L^2})$.³

We remind ourselves that for $x \in \mathbb{R}$,⁴

$$e^{-x^2} = 2^{-1} \pi^{-1/2} \int_{\mathbb{R}} e^{-y^2/4} e^{-ixy} dy,$$

and by the dominated convergence theorem this yields

$$D^n e^{-x^2} = 2^{-1} \pi^{-1/2} \int_{\mathbb{R}} (-iy)^n e^{-y^2/4} e^{-ixy} dy,$$

and so

$$h_n(x) = (2^n n! \sqrt{\pi})^{-1/2} e^{x^2/2} \cdot 2^{-1} \pi^{-1/2} \int_{\mathbb{R}} (iy)^n e^{-y^2/4} e^{-ixy} dy. \quad (2)$$

³<http://individual.utoronto.ca/jordanbell/notes/gaussian.pdf>, Theorem 8.

⁴<http://individual.utoronto.ca/jordanbell/notes/completelymonotone.pdf>, Lemma 5.

4 Mehler's formula

We now prove **Mehler's formula** for the Hermite functions.⁵

Theorem 1 (Mehler's formula). *For $z \in \mathbb{C}$ with $|z| < 1$ and for $x, y \in \mathbb{R}$,*

$$\sum_{n=0}^{\infty} h_n(x) h_n(y) z^n = \pi^{-1/2} (1-z^2)^{-1/2} \exp \left(-\frac{1}{2} \cdot \frac{1+z^2}{1-z^2} (x^2 + y^2) + \frac{2z}{1-z^2} xy \right).$$

Proof. Using (2),

$$\begin{aligned} & \sum_{n=0}^{\infty} h_n(x) h_n(y) z^n \\ &= \sum_{n=0}^{\infty} \frac{\sqrt{\pi}}{2^n n!} e^{(x^2+y^2)/2} z^n \left(\int_{\mathbb{R}} (2\pi i \xi)^n e^{-\pi^2 \xi^2} e^{-2\pi i x \xi} d\xi \right) \left(\int_{\mathbb{R}} (2\pi i \zeta)^n e^{-\pi^2 \zeta^2} e^{-2\pi i y \zeta} d\zeta \right) \\ &= \sqrt{\pi} e^{(x^2+y^2)/2} \int_{\mathbb{R}} \int_{\mathbb{R}} e^{-\pi^2 \xi^2 - \pi^2 \zeta^2 - 2\pi i x \xi - 2\pi i y \zeta} \sum_{n=0}^{\infty} \frac{(-2\pi^2 \xi \zeta z)^n}{n!} d\xi d\zeta \\ &= \sqrt{\pi} e^{(x^2+y^2)/2} \int_{\mathbb{R}} \int_{\mathbb{R}} e^{-\pi^2 \xi^2 - \pi^2 \zeta^2 - 2\pi i x \xi - 2\pi i y \zeta} e^{-2\pi^2 \xi \zeta z} d\xi d\zeta. \end{aligned}$$

Now, writing $a = \frac{iy}{\pi} + \xi z$, we calculate

$$\begin{aligned} \int_{\mathbb{R}} e^{-\pi^2 \zeta^2 - 2\pi i \zeta y - 2\pi^2 \xi \zeta z} d\zeta &= \int_{\mathbb{R}} e^{-\pi^2 (\zeta+a)^2 + \pi^2 a^2} d\zeta \\ &= \frac{1}{\sqrt{\pi}} e^{\pi^2 a^2} \\ &= \frac{1}{\sqrt{\pi}} \exp \left(-y^2 + 2\pi i y \xi z + \pi^2 \xi^2 z^2 \right). \end{aligned}$$

⁵Sundaram Thangavelu, *An Introduction to the Uncertainty Principle: Hardy's Theorem on Lie Groups*, p. 8, Proposition 1.2.1.

Then, for $\alpha = (1 - z^2)\pi^2$,

$$\begin{aligned}
& \sum_{n=0}^{\infty} h_n(x)h_n(y)z^n \\
&= e^{(x^2+y^2)/2} \int_{\mathbb{R}} e^{-\pi^2\xi^2 - 2\pi i x\xi - y^2 + 2\pi i y\xi z + \pi^2\xi^2 z^2} d\xi \\
&= e^{(x^2-y^2)/2} \int_{\mathbb{R}} e^{-\alpha\xi^2 - 2\pi i(x-yz)\xi} d\xi \\
&= e^{(x^2-y^2)/2} \sqrt{\frac{\pi}{\alpha}} \exp\left(-\frac{\pi^2}{\alpha}(x-yz)^2\right) \\
&= \pi^{-1/2} e^{(x^2-y^2)/2} (1-z^2)^{-1/2} \exp\left(-\frac{(x-yz)^2}{1-z^2}\right) \\
&= \pi^{-1/2} (1-z^2)^{-1/2} \exp\left(-\frac{x^2}{1-z^2} + \frac{2xyz}{1-z^2} - \frac{y^2 z^2}{1-z^2} + \frac{x^2}{2} - \frac{y^2}{2}\right) \\
&= \pi^{-1/2} (1-z^2)^{-1/2} \exp\left(-\frac{1}{2} \frac{1+z^2}{1-z^2} (x^2+y^2) + \frac{2z}{1-z^2} xy\right).
\end{aligned}$$

□

5 The Hermite operator

We define $A : \mathcal{S} \rightarrow \mathcal{S}$ by

$$(A\phi)(x) = -\phi''(x) + (x^2 + 1)\phi(x), \quad x \in \mathbb{R},$$

i.e.,

$$A = -D^2 + M^2 + 1,$$

which is a continuous linear map $\mathcal{S} \rightarrow \mathcal{S}$, which we call the **Hermite operator**. \mathcal{S} is a dense linear subspace of the Hilbert space $L^2(\lambda)$, and $A : \mathcal{S} \rightarrow \mathcal{S}$ is a linear map, so A is a densely defined operator in $L^2(\lambda)$. For $\phi, \psi \in \mathcal{S}$, integrating by parts,

$$\begin{aligned}
(A\phi, \psi)_{L^2} &= \int_{\mathbb{R}} (-\phi''(x) + (x^2 + 1)\phi(x)) \overline{\psi(x)} d\lambda(x) \\
&= \int_{\mathbb{R}} -\phi''(x) \overline{\psi(x)} d\lambda(x) + \int_{\mathbb{R}} (x^2 + 1)\phi(x) \overline{\psi(x)} d\lambda(x) \\
&= \int_{\mathbb{R}} -\phi(x) \overline{\psi''(x)} d\lambda(x) + \int_{\mathbb{R}} (x^2 + 1)\phi(x) \overline{\psi(x)} d\lambda(x) \\
&= (\phi, A\psi)_{L^2},
\end{aligned}$$

showing that $A : \mathcal{S} \rightarrow \mathcal{S}$ is symmetric. Furthermore, also integrating by parts,

$$(A\phi, \phi)_{L^2} = \int_{\mathbb{R}} (\phi'(x) \overline{\phi'(x)} + (x^2 + 1)\phi(x) \overline{\phi(x)}) d\lambda(x) \geq 0,$$

so A is a positive operator.

It is straightforward to check that each h_n belongs to \mathcal{S} . For $n \geq 0$, we calculate that

$$h_n''(x) + (2n + 1 - x^2)h_n(x) = 0,$$

and hence

$$(Ah_n)(x) = (2n + 1 - x^2)h_n(x) + x^2h_n(x) = (2n + 2)h_n(x),$$

i.e.

$$Ah_n = (2n + 2)h_n.$$

Therefore, for each h_n , $A^{-1}h_n = \frac{1}{2n+2}h_n$, and it follows that there is a unique bounded linear operator $T : L^2(\lambda) \rightarrow L^2(\lambda)$ such that⁶

$$Th_n = A^{-1}h_n = (2n + 2)^{-1}h_n, \quad n \geq 0. \quad (3)$$

The operator norm of T is

$$\|T\| = \sup_{n \geq 0} \frac{1}{2n + 2} = \frac{1}{2}.$$

The Hermite functions are an orthonormal basis for $L^2(\lambda)$, so for $f \in L^2(\lambda)$,

$$f = \sum_{n=0}^{\infty} (f, h_n)_{L^2} h_n.$$

For $f, g \in L^2(\lambda)$,

$$\begin{aligned} (Tf, g)_{L^2} &= \left(\sum_{n=0}^{\infty} (f, h_n)_{L^2} Th_n, \sum_{n=0}^{\infty} (g, h_n)_{L^2} h_n \right)_{L^2} \\ &= \left(\sum_{n=0}^{\infty} (f, h_n)_{L^2} (2n + 2)^{-1} h_n, \sum_{n=0}^{\infty} (g, h_n)_{L^2} h_n \right)_{L^2} \\ &= \sum_{n=0}^{\infty} (2n + 2)^{-1} (f, h_n)_{L^2} \overline{(g, h_n)_{L^2}}, \end{aligned}$$

from which it is immediate that T is self-adjoint.

For $p \geq 0$,

$$|T^p h_n|_{L^2}^2 = |(2n + 2)^{-p} h_n|_{L^2}^2 = (2n + 2)^{-2p} |h_n|_{L^2}^2 = (2n + 2)^{-2p}.$$

Therefore for $p \geq 1$,

$$\sum_{n=0}^{\infty} |T^p h_n|_{L^2}^2 = \sum_{n=0}^{\infty} (2n + 2)^{-2p} = 2^{-2p} \sum_{m=1}^{\infty} m^{-2p} = 2^{-2p} \zeta(2p).$$

This means that for $p \geq 1$, T^p is a **Hilbert-Schmidt operator** with **Hilbert-Schmidt norm**⁷

$$\|T^p\|_{\text{HS}} = 2^{-p} \sqrt{\zeta(2p)}.$$

⁶<http://individual.utoronto.ca/jordanbell/notes/traceclass.pdf>, Theorem 11.

⁷<http://individual.utoronto.ca/jordanbell/notes/traceclass.pdf>, §7.

6 Creation and annihilation operators

Taking the derivative of (1) with respect to x gives

$$2 \sum_{n=0}^{\infty} \frac{1}{n!} H_n(x) z^{n+1} = \sum_{n=0}^{\infty} \frac{1}{n!} H'_n(x) z^n,$$

so $H'_0 = 0$ and for $n \geq 1$, $\frac{1}{n!} H'_n(x) = \frac{1}{(n-1)!} 2H_{n-1}(x)$, i.e.

$$H'_n = 2nH_{n-1},$$

and so

$$h'_n(x) = (2n)^{1/2} h_{n-1}(x) - xh_n(x),$$

i.e.

$$Dh_n = (2n)^{1/2} h_{n-1} - Mh_n.$$

Furthermore, from its definition we calculate

$$h'_n(x) = xh_n(x) - (2n+2)^{1/2} h_{n+1}(x),$$

i.e.

$$Dh_n = Mh_n - (2n+2)^{1/2} h_{n+1}.$$

We define $B : \mathcal{S} \rightarrow \mathcal{S}$, called the **annihilation operator**, by

$$(B\phi)(x) = \phi'(x) + x\phi(x), \quad x \in \mathbb{R},$$

i.e.

$$B = D + M,$$

which is a continuous linear map $\mathcal{S} \rightarrow \mathcal{S}$. For $n \geq 1$, we calculate

$$Bh_n = (2n)^{1/2} h_{n-1},$$

and $h_0(x) = \pi^{-1/4} e^{-x^2/2}$, so $Bh_0 = 0$.

We define $C : \mathcal{S} \rightarrow \mathcal{S}$, called the **creation operator**, by

$$(C\phi)(x) = -\phi'(x) + x\phi(x), \quad x \in \mathbb{R},$$

i.e.

$$C = -D + M,$$

which is a continuous linear map $\mathcal{S} \rightarrow \mathcal{S}$. For $n \geq 0$, we calculate

$$Ch_n = (2n+2)^{1/2} h_{n+1}.$$

Thus,

$$h_n = (2^n n!)^{-1/2} C^n h_0 = \pi^{-1/4} (2^n n!)^{-1/2} C^n (e^{-x^2/2}). \quad (4)$$

For $\phi \in \mathcal{S}$,

$$B - C = 2D.$$

Furthermore,

$$BC = -D^2 + M^2 + 1 = A$$

and

$$CB = -D^2 + M^2 - 1 = A - 2.$$

7 The Fourier transform

Define $\mathcal{F} : \mathcal{S} \rightarrow \mathcal{S}$, for $\phi \in \mathcal{S}$, by

$$(\mathcal{F}\phi)(\xi) = \hat{\phi}(\xi) = \int_{\mathbb{R}} \phi(x) e^{-i\xi x} \frac{dx}{(2\pi)^{1/2}}, \quad \xi \in \mathbb{R}.$$

For $\xi \in \mathbb{R}$, by the dominated convergence theorem we have

$$\lim_{h \rightarrow 0} \frac{\hat{\phi}(\xi + h) - \hat{\phi}(\xi)}{h} = \int_{\mathbb{R}} (-ix) \phi(x) e^{-i\xi x} \frac{dx}{(2\pi)^{1/2}},$$

i.e.

$$\widehat{x\phi(x)}(\xi) = -i^{-1} D\hat{\phi}(\xi) = iD\hat{\phi}(\xi),$$

in other words,

$$\mathcal{F}(M\phi) = iD(\mathcal{F}\phi). \quad (5)$$

Also, by the dominated convergence theorem we obtain

$$\widehat{D\phi}(\xi) = i\xi\hat{\phi}(\xi),$$

in other words,

$$\mathcal{F}(D\phi) = iM(\mathcal{F}\phi). \quad (6)$$

For $\phi \in \mathcal{S}$,

$$\phi(x) = \int_{\mathbb{R}} \hat{\phi}(\xi) e^{ix\xi} \frac{d\xi}{(2\pi)^{1/2}}, \quad x \in \mathbb{R}. \quad (7)$$

$\phi \mapsto \hat{\phi}$ is an isomorphism of locally convex spaces $\mathcal{S} \rightarrow \mathcal{S}$.⁸ Using (7) and the Cauchy-Schwarz inequality

$$\begin{aligned} \|\phi\|_{\infty} &\leq \int_{\mathbb{R}} (1 + \xi^2)^{1/2} (1 + \xi^2)^{-1/2} |\hat{\phi}(\xi)| \frac{d\xi}{(2\pi)^{1/2}} \\ &\leq (2\pi)^{-1/2} \left(\int_{\mathbb{R}} (1 + \xi^2)^{-1} d\xi \right)^{1/2} \left(\int_{\mathbb{R}} (1 + \xi^2) |\hat{\phi}(\xi)|^2 d\xi \right)^{1/2} \\ &= 2^{-1/2} \left(\int_{\mathbb{R}} (1 + \xi^2) |\hat{\phi}(\xi)|^2 d\xi \right)^{1/2}, \end{aligned}$$

and using (6) and the fact that $|\hat{\phi}|_{L^2} = |\phi|_{L^2}$,

$$\begin{aligned} \|\phi\|_{\infty}^2 &\leq 2^{-1} \int_{\mathbb{R}} |\hat{\phi}(\xi)|^2 d\xi + 2^{-1} \int_{\mathbb{R}} \xi^2 |\hat{\phi}(\xi)|^2 d\xi \\ &= 2^{-1} \int_{\mathbb{R}} |\hat{\phi}(\xi)|^2 d\xi + 2^{-1} \int_{\mathbb{R}} |(\mathcal{F}\phi')(\xi)|^2 d\xi \\ &= 2^{-1} |\phi|_{L^2}^2 + 2^{-1} |\phi'|_{L^2}^2, \end{aligned}$$

⁸Walter Rudin, *Functional Analysis*, second ed., p. 186, Theorem 7.7.

and therefore

$$\|\phi\|_\infty \leq 2^{-1/2}(|\phi|_{L^2} + |\phi'|_{L^2}). \quad (8)$$

We remind ourselves that

$$A = -D^2 + M^2 + 1, \quad B = D + M, \quad C = -D + M.$$

Using

$$\mathcal{F}D = iM\mathcal{F}, \quad D\mathcal{F} = \frac{1}{i}\mathcal{F}M,$$

we get

$$\begin{aligned} \mathcal{F}A &= \mathcal{F}(-D^2 + M^2 + 1) \\ &= -(iM\mathcal{F})D + (iD\mathcal{F})M + \mathcal{F} \\ &= -iM(iM\mathcal{F}) + iD(iD\mathcal{F}) + \mathcal{F} \\ &= M^2\mathcal{F} - D^2\mathcal{F} + \mathcal{F} \\ &= A\mathcal{F}, \end{aligned}$$

and

$$\mathcal{F}B = \mathcal{F}(D + M) = iM\mathcal{F} + iD\mathcal{F} = iB\mathcal{F}$$

and

$$\mathcal{F}C = \mathcal{F}(-D + M) = -iM\mathcal{F} + iD\mathcal{F} = -iC\mathcal{F}.$$

We now determine the Fourier transform of the Hermite functions.

Theorem 2. For $n \geq 0$,

$$\mathcal{F}h_n = (-i)^n h_n.$$

Proof. For $n \geq 0$, by induction, from $\mathcal{F}C = -iC\mathcal{F}$ we get

$$\mathcal{F}C^n = (-iC)^n \mathcal{F}.$$

From (4),

$$h_n = \pi^{-1/4}(2^n n!)^{-1/2} C^n(e^{-x^2/2}).$$

Writing $g(x) = e^{-x^2/2}$, it is a fact that

$$\mathcal{F}g = g,$$

and using this with the above yields

$$\begin{aligned} \mathcal{F}h_n &= \pi^{-1/4}(2^n n!)^{-1/2} \mathcal{F}C^n g \\ &= \pi^{-1/4}(2^n n!)^{-1/2} (-iC)^n \mathcal{F}g \\ &= \pi^{-1/4}(2^n n!)^{-1/2} (-iC)^n g \\ &= \pi^{-1/4}(2^n n!)^{-1/2} (-i)^n \cdot \pi^{1/4}(2^n n!)^{1/2} h_n \\ &= (-i)^n h_n. \end{aligned}$$

□

There is a unique Hilbert space isomorphism $\mathcal{F} : L^2(\lambda) \rightarrow L^2(\lambda)$ such that $\mathcal{F}f = \hat{f}$ for all $f \in \mathcal{S}$.⁹ For $f \in L^2(\lambda)$,

$$f = \sum_{n=0}^{\infty} (f, h_n)_{L^2} h_n,$$

and then

$$\mathcal{F}f = \sum_{n=0}^{\infty} (f, h_n)_{L^2} \mathcal{F}h_n = \sum_{n=0}^{\infty} (f, h_n)_{L^2} (-i)^n h_n.$$

8 Asymptotics

For $x = 0$, (1) reads

$$\sum_{n=0}^{\infty} \frac{1}{n!} H_n(0) z^n = \exp(-z^2) = \sum_{n=0}^{\infty} \frac{(-z^2)^n}{n!},$$

thus

$$H_{2n}(0) = (-1)^n \frac{(2n)!}{n!}, \quad H_{2n+1}(0) = 0.$$

Similarly, taking the derivative of (1) with respect to x yields

$$H'_{2n}(0) = 0, \quad H'_{2n+1}(0) = 2(-1)^n \frac{(2n+1)!}{n!}.$$

For $u(x) = e^{-x^2/2} H_n(x)$,¹⁰

$$u'(x) = -xu + e^{-x^2/2} H'_n(x), \quad u''(x) = -u - xu' - xe^{-x^2/2} H'_n(x) + e^{-x^2/2} H''_n(x).$$

Using

$$H'_n(x) = 2xH_n(x) - H_{n+1}(x), \quad H'_n(x) = 2nH_{n-1}(x)$$

we get

$$H''_n(x) - 2xH'_n(x) + 2nH_n(x) = 0,$$

and thence

$$u'' = -u + x^2u - 2nu.$$

Thus, writing $f(x) = x^2u(x)$, u satisfies the initial value problem

$$v'' + (2n+1)v = f, \quad v(0) = H_n(0), \quad v'(0) = H'_n(0). \quad (9)$$

Now, for $\lambda > 0$, two linearly independent solutions of $v'' + \lambda v = 0$ are $v_1(x) = \cos(\lambda^{1/2}x)$ and $v_2(x) = \sin(\lambda^{1/2}x)$. The Wronskian of (v_1, v_2) is $W = \lambda^{1/2}$, and

⁹Walter Rudin, *Functional Analysis*, second ed., p. 188, Theorem 7.9.

¹⁰N. N. Lebedev, *Special Functions and Their Applications*, p. 66, §4.14.

using variation of parameters, if v satisfies $v'' + \lambda v = g$ then there are c_1, c_2 such that

$$v(x) = c_1 v_1 + c_2 v_2 + A v_1 + B v_2,$$

where

$$A(x) = - \int_0^x \frac{1}{W} v_2(t) g(t) dt, \quad B(x) = \int_0^x \frac{1}{W} v_1(t) g(t) dt.$$

We calculate that the unique solution of the initial value problem $v'' + \lambda v = g$, $v(0) = a$, $v'(0) = b$, is

$$\begin{aligned} v(x) &= a v_1(x) + b \lambda^{-1/2} v_2(x) \\ &\quad - \lambda^{-1/2} v_1(x) \int_0^x v_2(t) g(t) dt + \lambda^{-1/2} v_2(x) \int_0^x v_1(t) g(t) dt \\ &= a \cos(\lambda^{1/2} x) + b \lambda^{-1/2} \sin(\lambda^{1/2} x) \\ &\quad + \lambda^{-1/2} \int_0^x (\cos(\lambda^{1/2} t) \sin(\lambda^{1/2} x) - \sin(\lambda^{1/2} t) \cos(\lambda^{1/2} x)) g(t) dt \\ &= a \cos(\lambda^{1/2} x) + b \lambda^{-1/2} \sin(\lambda^{1/2} x) + \lambda^{-1/2} \int_0^x \sin(\lambda^{1/2}(x-t)) g(t) dt. \end{aligned}$$

Therefore the unique solution of the initial value problem (9) is

$$\begin{aligned} v(x) &= H_n(0) \cos((2n+1)^{1/2} x) + H'_n(0) (2n+1)^{-1/2} \sin((2n+1)^{1/2} x) \\ &\quad + (2n+1)^{-1/2} \int_0^x \sin((2n+1)^{1/2}(x-t)) \cdot t^2 u(t) dt, \end{aligned}$$

where $u(x) = e^{-x^2/2} H_n(x)$. If $n = 2k$ then

$$\begin{aligned} v(x) &= (-1)^k \frac{(2k)!}{k!} \cos((4k+1)^{1/2} x) \\ &\quad + (4k+1)^{-1/2} \int_0^x \sin((4k+1)^{1/2}(x-t)) \cdot t^2 u(t) dt \\ &= (-1)^k \frac{(2k)!}{k!} \cos((4k+1)^{1/2} x) + (4k+1)^{-1/2} r_{2k}(x). \end{aligned}$$

We calculate

$$\begin{aligned} |r_{2k}(x)|^2 &\leq \left(\int_0^{|x|} t^4 dt \right) \left(\int_0^{|x|} |u(t)|^2 dt \right) \\ &\leq \frac{|x|^5}{10} \cdot \int_{\mathbb{R}} e^{-t^2} |H_{2k}(t)|^2 dt \\ &= \frac{|x|^5}{10} \cdot 2^{2k} (2k)! \sqrt{\pi}, \end{aligned}$$

i.e.

$$|r_{2k}(x)| \leq \pi^{1/4} \frac{|x|^{5/2}}{\sqrt{10}} 2^k \sqrt{(2k)!}.$$

By Stirling's approximation,

$$\frac{2^k \sqrt{(2k)!}}{\frac{(2k)!}{k!}} = \frac{2^k k!}{\sqrt{(2k)!}} \sim \frac{2^k (2\pi k)^{1/2} k^k e^{-k}}{((4\pi k)^{1/2} (2k)^{2k} e^{-2k})^{1/2}} = \pi^{1/4} k^{1/4}.$$

Thus for $\alpha_{2k} = \frac{(2k)!}{k!}$,

$$\frac{|r_{2k}(x)|}{\alpha_{2k}} = O(|x|^{5/2} \cdot k^{1/4} \cdot k^{-1/2}) = O(|x|^{5/2} k^{-1/4}).$$

Thangavelu states the following inequality and asymptotics without proof, and refers to Szegő and Muckenhoupt.¹¹

Lemma 3. *There are $\gamma, C, \epsilon > 0$ such that for $N = 2n + 1$,*

$$\begin{aligned} |h_n(x)| &\leq C(N^{1/3} + |x^2 - N|)^{-1/4}, & x^2 \leq 2N \\ &\leq Ce^{-\gamma x^2}, & x^2 > 2N, \end{aligned}$$

and

$$|h_n(x)| \leq N^{-1/8} (x - N^{1/2})^{-1/4} e^{-\epsilon N^{1/4} (x - N^{1/2})^{3/2}}$$

for $N^{1/2} + N^{-1/6} \leq x \leq (2N)^{1/2}$.

Lemma 4. *For $N = 2n + 1$, $0 \leq x \leq N^{1/2} - N^{-1/6}$, and $\theta = \arccos(xN^{-1/2})$,*

$$h_n(x) = \left(\frac{2}{\pi}\right)^{1/2} (N - x^2)^{-1/4} \cos\left(\frac{N(2\theta - \sin \theta) - \pi}{4}\right) + O(N^{1/2}(N - x^2)^{-7/4}).$$

Theorem 5. 1. $\|h_n\|_p \asymp n^{\frac{1}{2p} - \frac{1}{4}}$ for $1 \leq p < 4$.

2. $\|h_n\|_p \asymp n^{-\frac{1}{8}} \log n$ for $p = 4$.

3. $\|h_n\|_p \asymp n^{-\frac{1}{6p} - \frac{1}{12}}$ for $4 < p \leq \infty$.

Rather than taking the p th power of h_n , one can instead take the p th power of H_n and integrate this with respect to Gaussian measure. Writing $d\gamma(x) = (2\pi)^{-1/2} e^{-x^2/2} dx$ and taking H_n to be the Hermite polynomial that is monic, now write

$$\|H_n\|_p^p = \int_{\mathbb{R}} |H_n|^p d\gamma.$$

Larsson-Cohn¹² proves that for $0 < p < 2$ there is an explicit $c(p)$ such that

$$\|H_n\|_p = \frac{c(p)}{n^{1/4}} \sqrt{n!} (1 + O(n^{-1})),$$

¹²Lars Larsson-Cohn, *L^p -norms of Hermite polynomials and an extremal problem on Wiener chaos*, Ark. Mat. **40** (2002), 134–144.

and for $2 < p < \infty$ there is an explicit $c(p)$ such that

$$\|H_n\|_p = \frac{c(p)}{n^{1/4}} \sqrt{n!} (p-1)^{n/2} (1 + O(n^{-1})).$$

This uses the asymptotic expansion of Plancherel and Rotach.¹³
